

Simple, quick & secure – “one click” digital nursing report - containing medical and nursing information

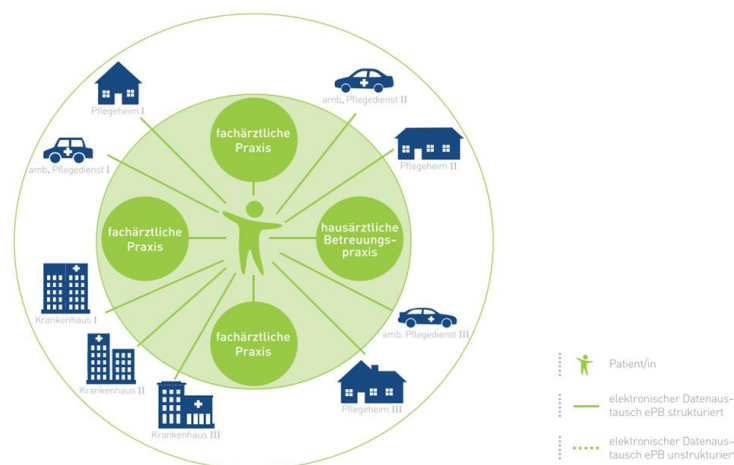

More patient safety through better communication as well as better cooperation between practitioners and nursing staff is the main focus of the project solimed ePflegerbericht. Practitioners and medical specialists, inpatient and ambulant care are testing the new digital communication system and the use of an electronical nursing report.

This new digital communication between local practitioners and nursing specialists is the first of its kind in Germany. All parties involved remain working with their existing communication system, but through a joint IT-interface the systems can communicate with each other. In case a patient will be transferred a newly developed electronical patient care report can be generated by “one click” out of the IT system and send to the staff taking care of the patient next.

In order to improve the interdisciplinary communication between practitioners and nursing staff today a simple process for ad hoc communication called solimed-mail as well as an automatic exchange of medical and nursing information necessary for an optimum patient care is put in place. First experiences already show the benefit of the communication tool in improving interdisciplinary communication.

The overall goal of the project is testing of the solimed digital nursing report as a prototype for the German health care system, integration of further nursing care organizations and the integration of the nursing staff in hospitals into the communication solution are planned. Furthermore an electronical medication management to optimize drug safety is intended to be developed and tested.

Background information solimed - Unternehmen Gesundheit

Since 2007 more than 70 practitioners and medical specialists as well as the three local hospitals in Solingen have been electronically networked running 25.000 decentralized digital patient records which support direct communication between practitioners, medical specialists as well as the hospitals. If required information such as medical reports, administered medication, lab results and letters can be exchanged without any loss of time.

Each patient creates his personal health network and sets up his own medical team. The solimed communication system was reviewed by the State data protection and the German TÜV. Optimized medical treatment through better communication, is the maxim of solimed. For further information please visit our website: www.solimed-ug.de
